Deployment routines

March 2023

1 Introduction

This document includes all the routines that need to be checked upon deployment.

Each item in the following list has a section explaining it in more detail below.

- Check browser compatibility on (Safari, Chrome, and Firefox). (These are the browsers supported by our out app).

1.1 Browser Compatibility

Browser validation is done manually whenever we merge to *main*. Each browser, Firefox, Safari, Chrome and IE, launched and checked by clicking every button to ensure they work as intended. Another thing to be wary of is the support of certain functions and directives. We constantly check to confirm that the browsers support the functions we use. (This is planned to be automatically checked using cypress).
